

Collaborative Engineering

Design for Environment

- Environmental Impact
- Design for Environment
- 3 'R' concept
- DFE Examples

OrthoCAD Lab, I.I.T. Bombay

Environmental Impact

Copiers and laser printers produce ozone and volatile organic compounds (VOCs) that cause lung irritation and breathing problems.

Materials in drum and toner are known to be carcinogens.

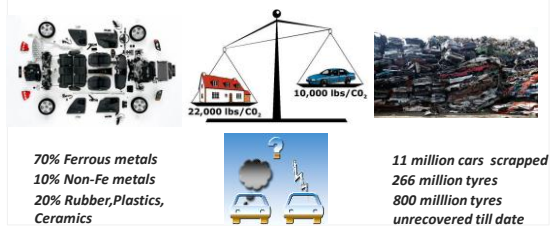

Other electronic devices, including laptops & batteries cause metallic pollution of cadmium, mercury and lead.

Environmental Impact

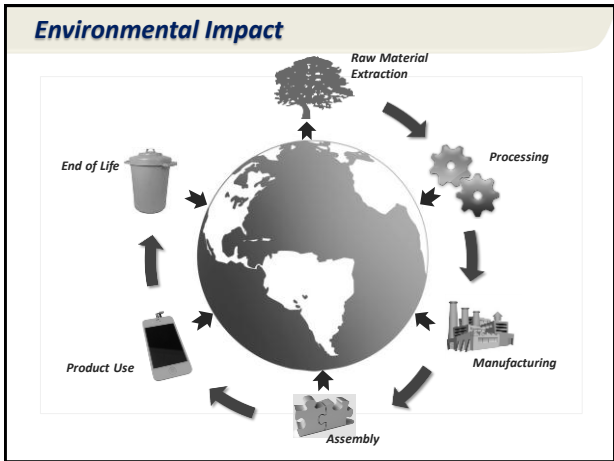

Environmental impact during:

Product manufacture	Product use & service	Product disposal
↓	↓	↓
Material consumption	Energy consumption	Pollution or waste

70% Ferrous metals
10% Non-Fe metals
20% Rubber, Plastics, Ceramics

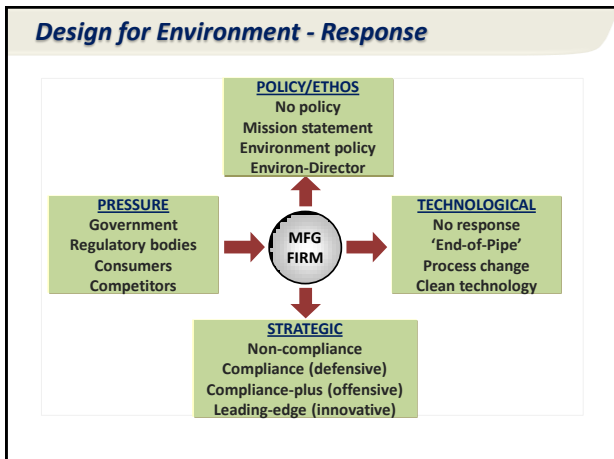

11 million cars scrapped
266 million tyres
800 million tyres unrecovered till date

Product End-of-Life

- End of life: obsolete functionality / irreparable / no buyers.
- Consumers can not just 'dump' the product anymore
- Regulations to make manufacturers responsible for EOL.
- Forces manufacturers to rethink design strategy
- DFE becoming a functional requirement, not just constraint!

Design for Environment - Definition

- Definition: Anticipating and eliminating negative impact of the lifecycle of a product on environment.
- Also referred to as *Green Design!*
- Negative impact on the environment:
 - Material and energy consumption
 - Generation of gaseous, liquid and solid wastes
- Life cycle of a product w.r.t. environment:
 - Raw material processing and manufacturing
 - Product distribution, use and service
 - Demanufacturing at the end of product life

Design for Environment - 3 R's

- Reduce: Design products and processes to reduce
 - Raw material use – shape optimization
 - Waste generation – less packaging
 - Energy consumption – efficient power packs

"Syreen": Cambridge Consultants

Material: Cyclic Olefin Polymer (COP)
Sheds the need for secondary packaging
Syringes can be clipped together
Eliminates the need for wasteful fillers such as cardboard and styrofoam, reducing the packaging weight by 30% and volume by 50%

Design for Environment - 3 R's

- Reuse: Design products for disassembly and reuse of parts
 - In same products – often more reliable
 - Secondary products – lower demanding (properties)

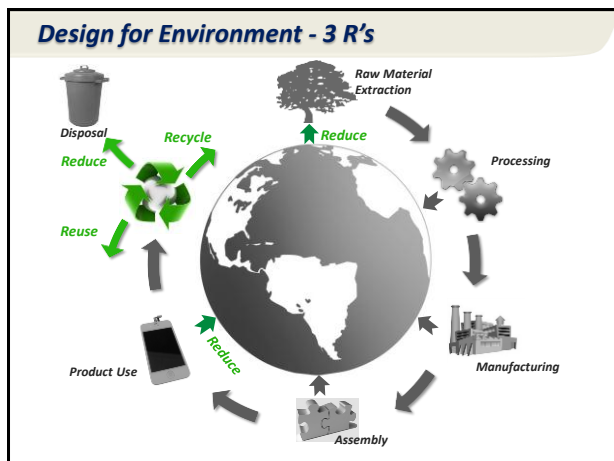

Regular skate decks reused and turned into a sustainable skate bench.

Design for Environment - 3 R's

- Recycle: Design products for ease of material separation and recycling the materials for other applications
 - Plastics, metals, ceramics
 - Use of mono materials

"Syreen": Cambridge Consultants

The chair is up to 94% recyclable itself (36% aluminum, 31% steel, 31% plastic) and made from 62% recycled materials
Takes just 2 hours to disassemble
Returnable/Recyclable package (cardboard box and plastic)

Design for Environment - Materials

- Avoid materials that:
 - Contaminate ground water
 - Generate toxic gases when burned

Nichola Coleman of the University of Greenwich, UK

Ground up glass into tobermorite: a compound that sucks up toxic materials from groundwater like Lead and cadmium

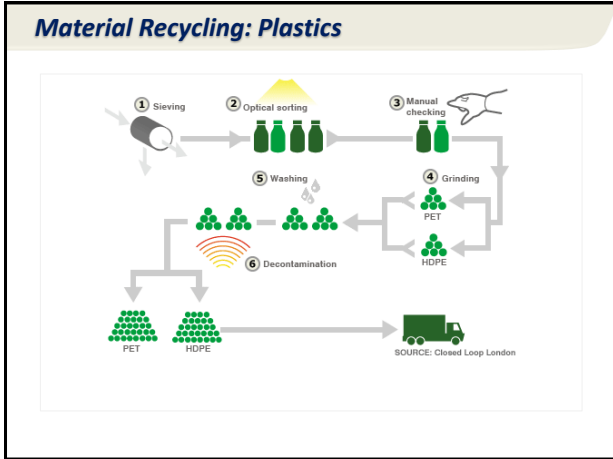

- Minimise use of all materials, especially scarce materials.
- Minimise or replace material use through technology.
- Minimise different types and volume of packaging.

Design for Environment - Materials

- Use recycled or easily recyclable materials:
 - metals better than plastics without losing properties
 - but metals use more energy in manufacturing
- Use bio-degradable materials.

Green Street Cooking Tools: Robinson Home Products

Made from recycled plastic water bottles that were turned into flakes, compressed, and shaped with the assistance of wind power
Heat resistant to 425 degrees

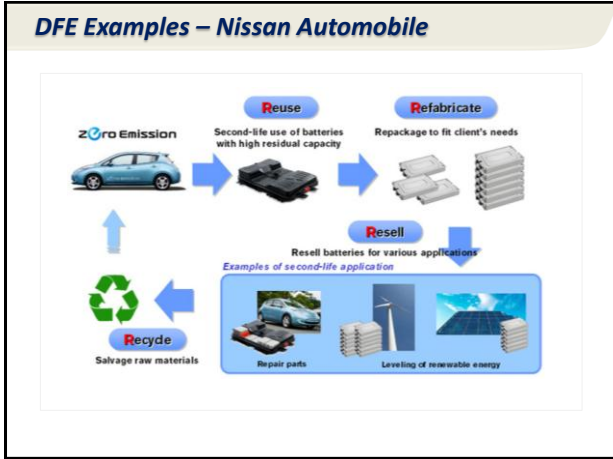

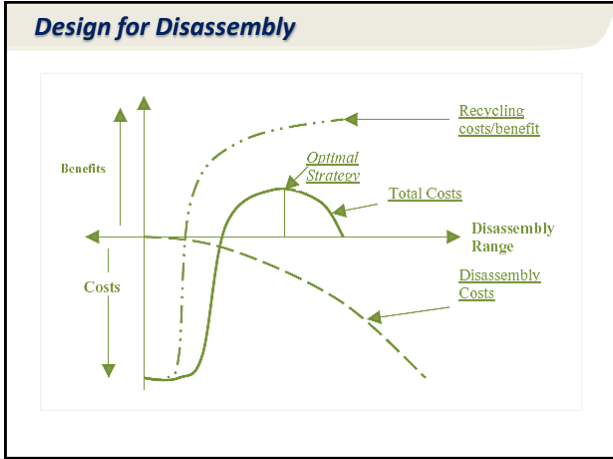

Design for Disassembly

- Definition:** Design products so they can be taken apart without any damage, so that they can be reused or recycled in other products.
- Disassembly by reverse assembly or brute force.
- Influenced by part value / disassembly cost.
- Proper documentation and procedure essential.

Low-cost floss container

Simple to assemble and disassembled.
Easy to open, free of glues, screws, or heat stakes.
Main component's material is clearly labeled
Parts are quickly separated. (10 sec)

DFE more Examples

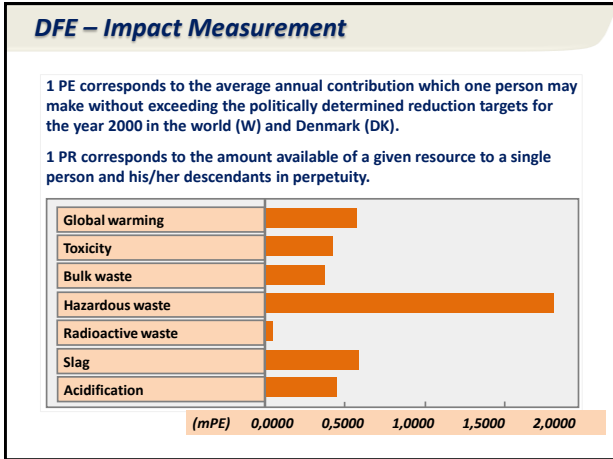

- Kodak has converted disposable cameras to recyclable ones. Now 87% of the cameras are either reused or recycled. 
- HP recycles up to 65% of print cartridges by weight. Remaining non recyclable parts are disposed of in an environmentally responsible manner. 
- Vehicle Recycling Development Center (joint venture of GM, Chrysler, Ford) finding is ways to recycle automobiles, and to disassemble them more cost-effectively.

DFE Challenges in Medical Products

- Regulations: limitations in design
- Virgin Materials: Molded parts should come from pure virgin pellets
- Sterilization: Material compatibility for sterilization
- Bio-Compatibility: Limits the material choice
- Single Use: Single use disposables 

SABIC innovative plastics: high quality eco friendly

- Design for Reuse: Reduce no. of disposable components
- Molding: Optimizing tools for less sprues, gating and flash in molding
- Design for Sterilization: New engineering plastics withstand temperatures
- Material Selection: Select a material requiring less energy
- DFA for less energy: Fastner, adhesive, snap-fit

SUMMARY

- Environmental impact in whole product lifecycle from materials to disposal
- Design for environment and 3R concept motivates designers for innovative solutions good for environment
- Industries are now aware and giving importance to design for environment and product lifecycle issues
- Medical products have a great impact in environment and also challenge in design for environment
